

ScarcAI by BuQuaTi

Why Unique?

Work-place security, Defense, Aerial Imager (satellite / drone/...), Agriculture, Health-care are some of the industries where rotation, and position of objects of all sizes are required with automatic learning of small number of available samples.

Rotational detection of the objects in a scene adds incredible value to the context as to where each object is directed to, and their respective positions with respect to each other.

Small Data
(Scarce/Frugal)
is a key accelerator in
real life adoption.

Mug detection has been
achieved with only 22
input images.

Small
Objects are a
challenge in
object detection
that we achieve
perfectly.
